BFS & DFS

For graph having nodes like 0, 1, ..., n-1 we can track visited as `vector<bool> visited(n, false);`

DFS

BFS

* Best suited for minimum Distance finding.

Cycle Detection

Undirected :-

```

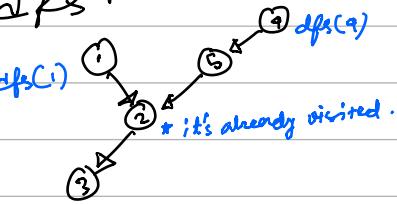

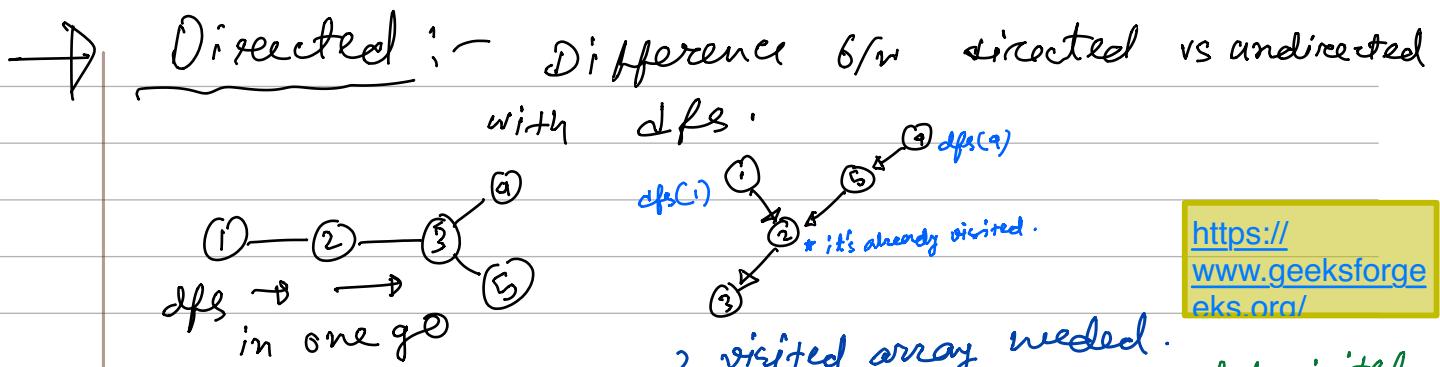

in BFS;           q.push({node, -1})
                  * Parent.
while (!q.empty()) {
    node, prev = q.pop();
    if (visited[node] == true) {
        * This is not necessary
        * // visited[next] = true;
        for (int next : node) {
            if (next == prev) continue;
            if (visited[next]) CYCLE
            q.push({next, node});
            * visited[next] = true;
        }
    }
}
  
```

* For a testcase like

in qFg it didn't pass with..

This is important

[https://
www.geeksforgeeks.org/](https://www.geeksforgeeks.org/)

2 visited array needed.
 ① global visited array (global visited needed otherwise TLE) gfg
 ② in dfs visited array

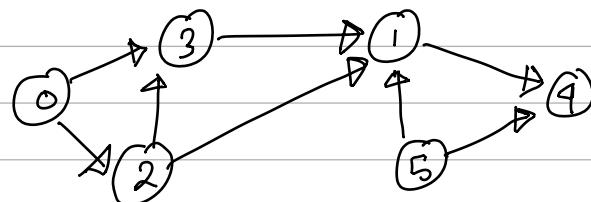

Topological Sorting

* if $(u) \rightarrow (v)$ then u must occur before v .

* Topological Sorting is only possible for DAG's.
 (Directed, No cycle).

* Multiple Topological sorting is possible.

E.g.

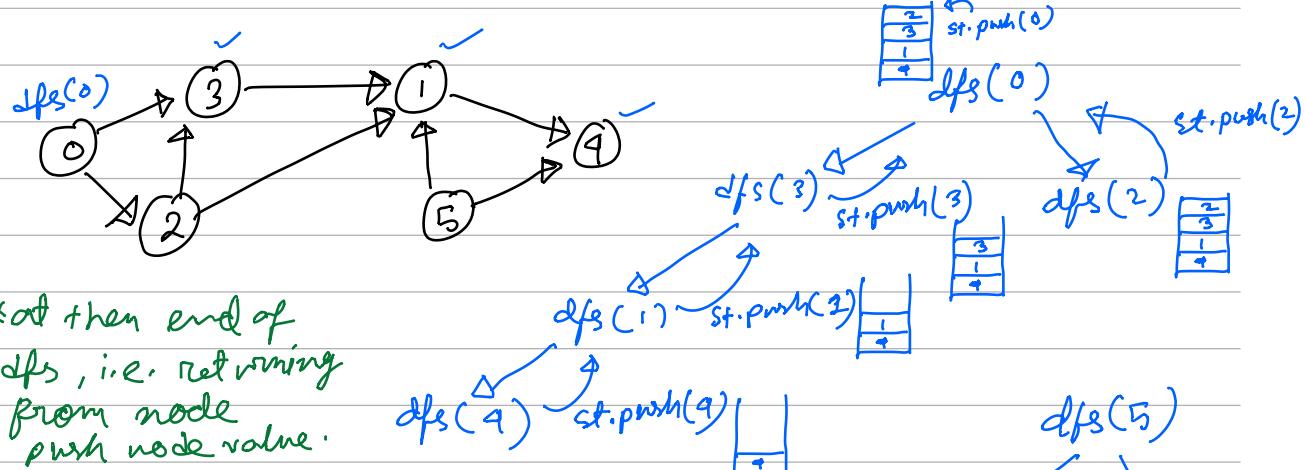

adj

| | | |
|---|---------------|------|
| 0 | \rightarrow | 3, 2 |
| 1 | \rightarrow | 4 |
| 2 | \rightarrow | 3, 1 |
| 3 | \rightarrow | 1 |
| 4 | \rightarrow | |
| 5 | \rightarrow | 1, 4 |

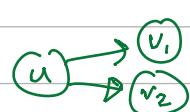

Topological Sorting

Using DFS :- DFS is topological sorting coz elements occur in their respective order.

* at the end of
 dfs, i.e. returning
 from node
 push node value.

* first push children
 then push yourself.

dfs(5)
 1 → visited q → visited
 so st.push(5)

Possible Topo order : u, v_1, v_2 or u, v_2, v_1

O Topological Sort + Cycle Detect DFS

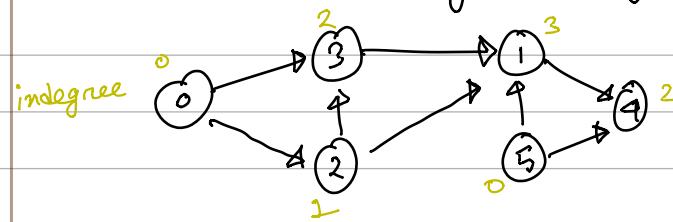

```
vector<int> topoOrder;
bool isCycle = False
vector<int> visited;
```

```
void DFSTraverse (adj , node, unordered_map<int, bool> & seen)
{
    visited [node] = True
    seen [node] = True

    for (int next : adj [node])
    {
        if (seen [next]) {
            isCycle = True
            return
        }
        if (visited [next]) continue;
        else DFSTraverse (adj, next, seen)
    }

    seen [node] = False
    topoOrder . pushback (node)
}
```

→ Topological Sorting Using BFS (KHAN's Algorithm)

adj.

| | | |
|---|---|------|
| 0 | → | 3, 2 |
| 1 | → | 9 |
| 2 | → | 3, 1 |
| 3 | → | 2 |
| 4 | → | |
| 5 | → | 1, 9 |

- ① push 0, 5 to queue
 - ② when an element is processed
decrease indegree of its children.
 - ③ if children's indegree = 0 push children to queue.

4 →
5 → 1, 2

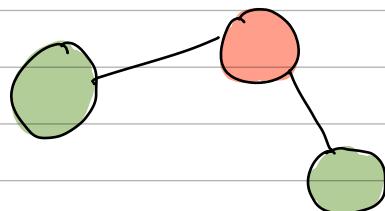

→ Detect Cycle using BFS ; -

return length of topological sorted list $l = \text{no. of nodes}$

<< Course Schedule I & II >>

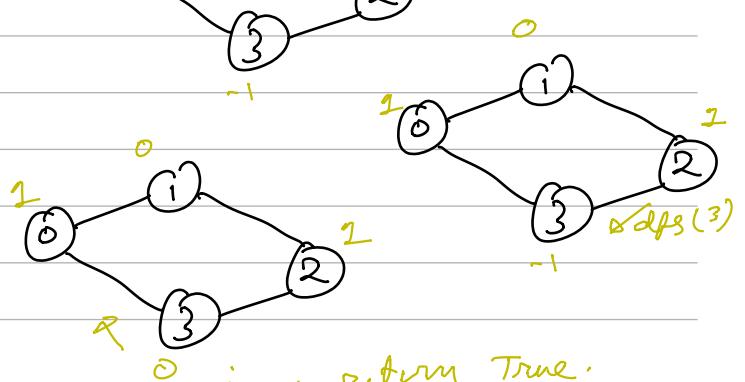

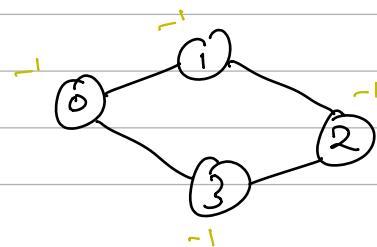

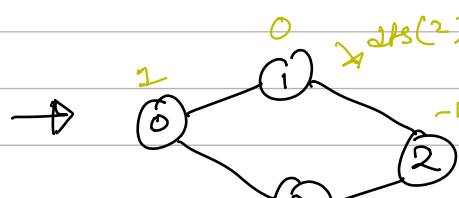

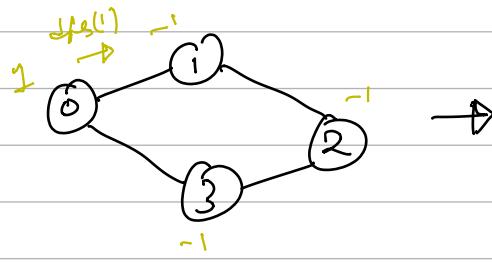

<https://leetcode.com/problems/>

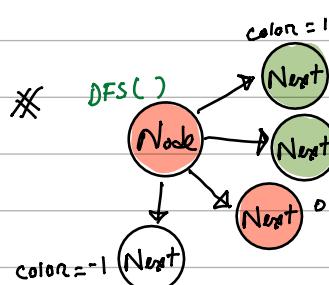

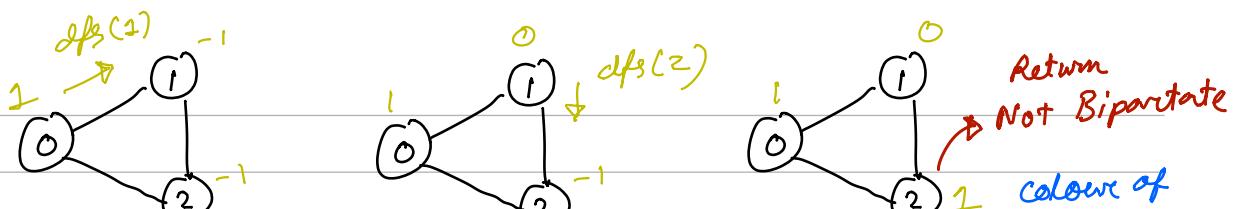

Bipartite Graph

* no 2 consecutive nodes have
same colour.

→ Using DFS :- # Use array colours [-1,-1,-1,-1] -1: unvisited
0: red
1: Black

* in DFS of Node, while going through children of Node.

color[Next] == color[Node] Not Bipartite!

color[Next+] is opposite of color[Node] No problem

color[Next-] == -1 (unvisited) call dfs(Next-)

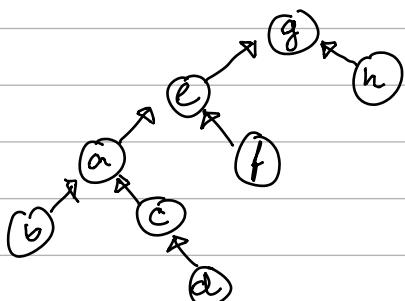

→ Similarly for BFS.

Disjoint Set Union / Union Find

disjoint set $\rightarrow S_1 \cap S_2 = \emptyset$

nodes : [a, b, c, d, e, f, g, h] all Disconnected
 parent: [a, b, c, d, e, f, g, h]

after changing union and all;

nodes: a b c d e f g h
 parent: e a a c e g e g g

```
// int findParent(int node, vector<int> &parent) {
    if (parent[node] == node) return node;
    return findParent(parent[node]); }
```

Time Complexity

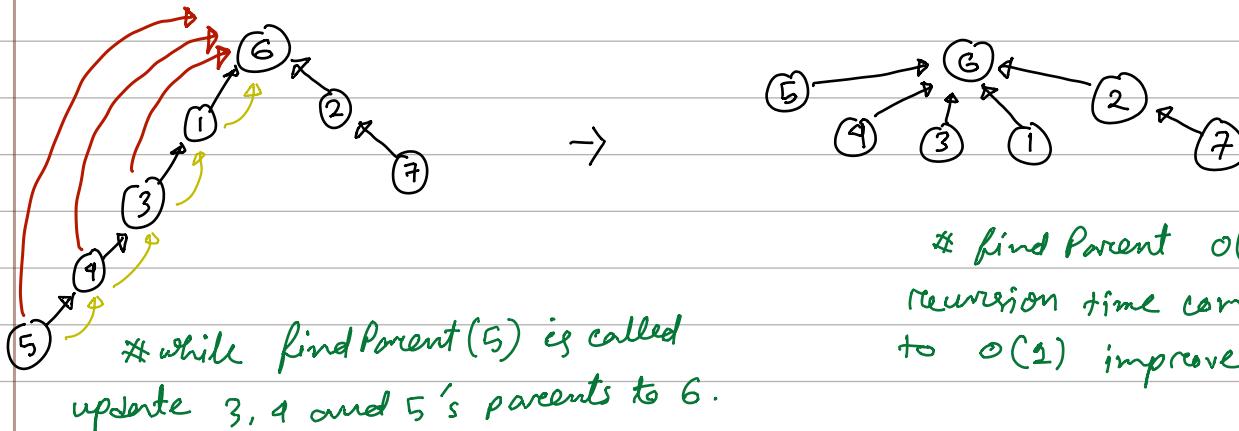

```
// void union(int a, int b, vector<int> &parent) {
    int parentOfA = findParent(a, parent);
    int parentOfB = findParent(b, parent);
    if (parentOfA != parentOfB) {
        parent[parentOfA] = parentOfB; } }
```

$= O(v+E)$

→ Optimization Using Path Compression and Rank :-

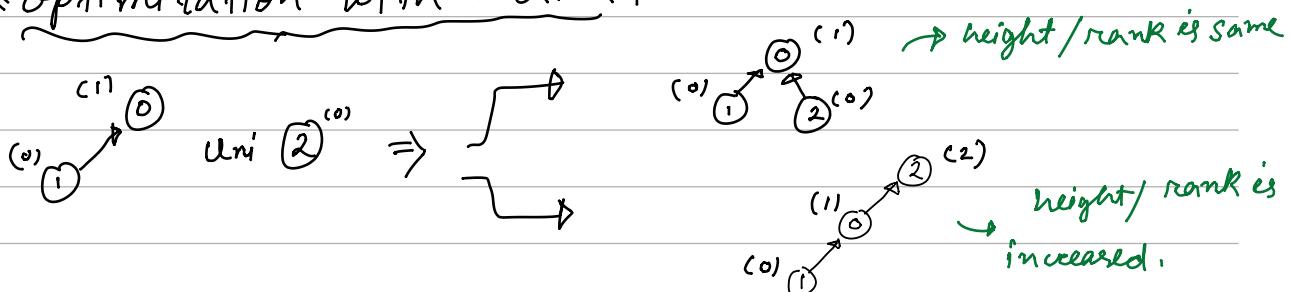

Path compression :-

```
// int findParent (int node, vector<int> & Parent) {
    if (parent[node] == node) return node;
    return Parent[node] = findParent(Parent[node]); }
```

* find Parent $O(n)$
recursion time complexity
to $O(1)$ improvement.

* optimization with Rank :-

```
// void Union (int A, int B, vector<int> & parent) {
    int parentA = findParent(A, parent);
    int parentB = findParent(B, parent);

    if (parentA == parentB) return;

    if (rank[parentA] > rank[parentB]) {
        parent[parentB] = parentA
    }

    else if (rank[parentA] < rank[parentB]) {
        parent[parentA] = parentB
    }

    else {
        parent[parentB] = parentA
        rank[parentA]++;
    }
}
```

→ Optimization using path compression & Size :-

Optimization Using Size :-

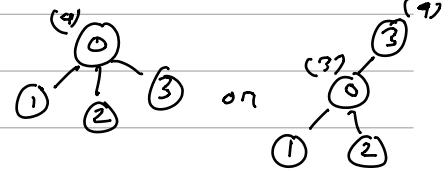

| | | | | | | |
|------|---|---|---|---|---|---|
| size | 0 | 1 | 2 | 3 | 4 | 5 |
| | 3 | 1 | 1 | 1 | 1 | 1 |

(1)

(2)

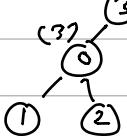

union(1, 3)

(4)

(5)

on

(6)

(7)

void makeUnion(int a, int b, vector<int> &parent)

{

 int pA = findParent(a, parent)

 int pB = findParent(b, parent)

 if (pA == pB) return

 if (size[pA] > size[pB]) {

 parent[pB] = pA

 size[pA]++

}

 else if (size[pA] < size[pB]) {

 parent[pA] = pB

 size[pB]++

}

 else {

 parent[pB] = pA

 size[pA]++

}

}

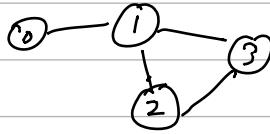

→ Detecting cycle Using DSU -

// For undirected graph ,

make all node in union if there

exist an edge . (iterate node in increasing order).

if any node reached again (parents are same)
there's a cycle .

→ Number of operations to make network connected :-

[Description](#) [Editorial](#) [Solutions](#) [Submissions](#)

1319. Number of Operations to Make Network Connected

Medium Topics Companies Hint

There are n computers numbered from 0 to $n - 1$ connected by ethernet cables forming a network where $\text{connections}[i] = [a_i, b_i]$ represents a connection between computers a_i and b_i . Any computer can reach any other computer directly or indirectly through the network.

You are given an initial computer network connections. You can extract certain cables between two directly connected computers, and place them between any pair of disconnected computers to make them directly connected.

Return the minimum number of times you need to do this in order to make all the computers connected. If it is not possible, return -1 .

Example 1:

Input: $n = 4$, $\text{connections} = [[0,1], [0,2], [1,2]]$
Output: 1
Explanation: Remove cable between computer 1 and 2 and place between computers 1 and 3.

Example 2:

Input: $n = 6$, $\text{connections} = [[0,1], [0,2], [0,3], [1,2], [1,3]]$
Output: 2
Explanation: Remove cable between computer 1 and 2 and place between computers 1 and 3.

Example 3:

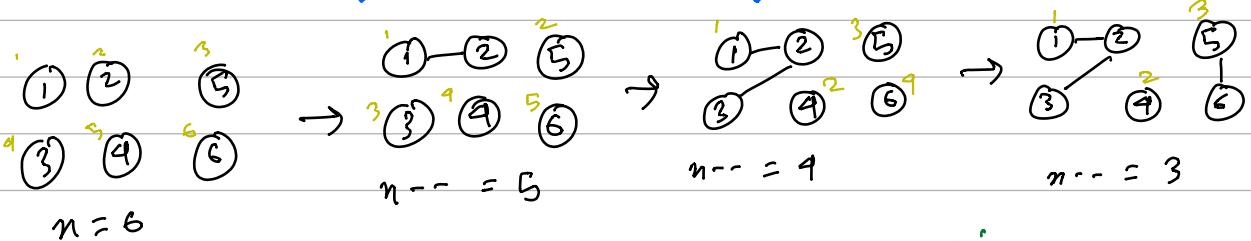

Input: $n = 6$, $\text{connections} = [[0,1], [0,2], [0,3], [1,2]]$
Output: -1
Explanation: There are not enough cables.

$$n = 6$$

$$\text{edges} = [\{0,1\}, \{0,2\}, \{0,3\}, \{1,2\}, \{1,3\}]$$

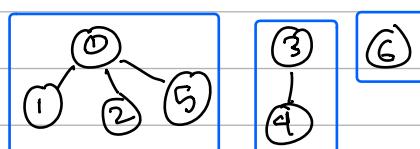

$i \rightarrow$

iterate over edges & count extra edges .

at each moment whenever there an union
Total no. of universal disconnect decreases ; even if union is
getting in a differen set . like in (5)-(6) set aside 1-3 set .

→ Count Unreachable Pairs

unordered map

0 : 4
3 : 2
6 : 1

how to calculate no. of pairs
count += size * remaining

$$\text{e.g. } 4 \times 3 + 2 \times 1 + 1 \times 0 = 19$$

or
 $2 \times 5 + 4 \times 1 = 19$
 $1 \times 6 + 2 \times 9 = 19$

<https://leetcode.com/problems/count-unreachable-pairs-in-a-graph/>

Dsu Question // satisfiability of equations

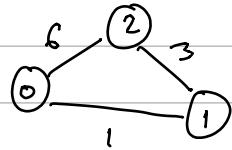

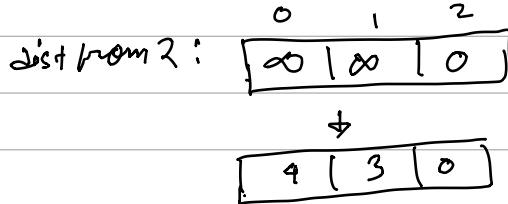

✓ no. of operation to make network connected

✓ count unreachable pairs

<https://leetcode.com/problems/count-unreachable-pairs-in-a-graph/>

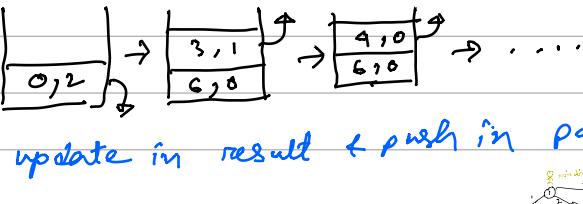

Dijkstras

* usage of min heap
`priority::queue<P, vector<P>, greater<P>>`

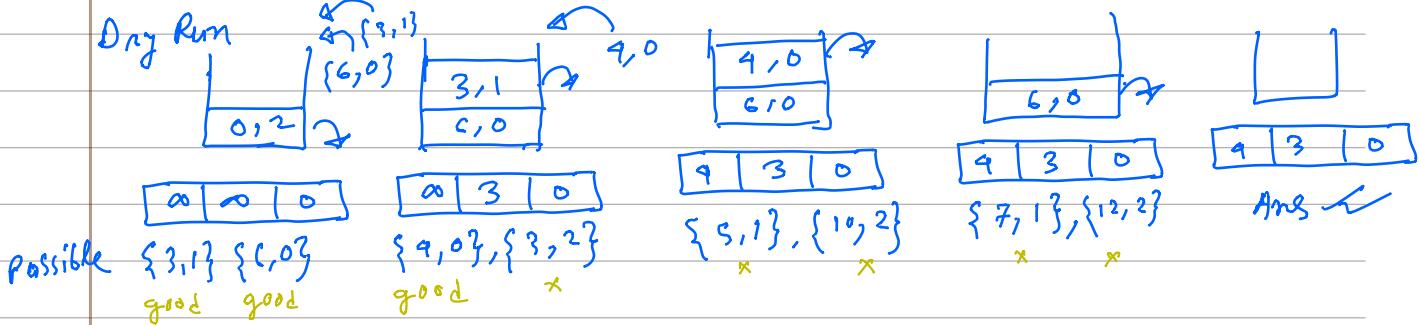

adj

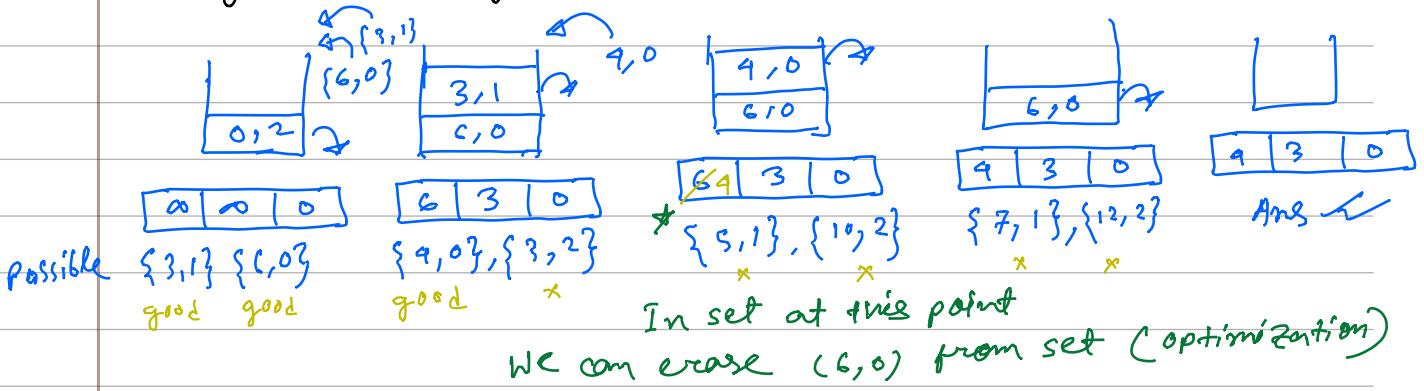

- 0 - {1, 13, {2, 6}}
- 1 - {0, 13, {2, 3}}
- 2 - {0, 6}, {1, 3}

Q: In step 1, why did we update min dist of 3 as 9
 A: Since 9 is less than 13, so we update min dist of 3 as 9

→ Dijkstra using Set :- (ordered set)

In set at this point

We can erase (6, 0) from set (optimization)

* `set.erase({random thing not present in set})` → doesn't give error

✓ why Queue is not used?

⇒ Priority Queue presents the smallest possible answer till that point. One may iterate over all possible min distances before the smallest possible.

→ Time Complexity :-

while (`pq != empty`) → v times

`pq.pop` → $\log v$

`for (next: node)` → E

`pq.push` → $\log v$

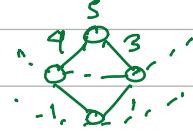

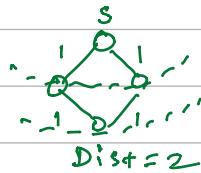

$$\text{Total} \approx E \log v + E \log v$$

$$= E \log v$$

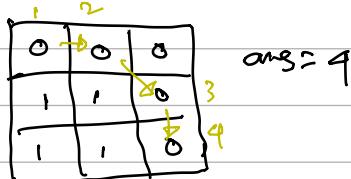

$$\approx \frac{E}{v-1} \log v$$

$$\approx v \log v$$

* BFS Doesn't work for shortest path whenever there's weight in path

→ Shortest path in binary Matrix

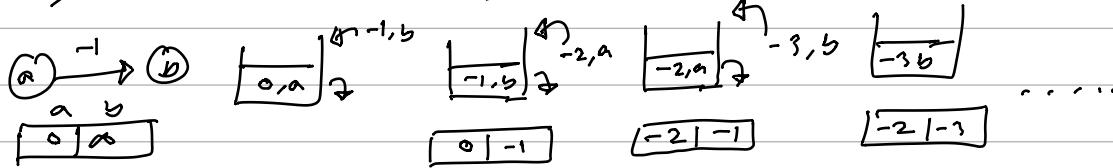

BFS ✓ Dijkstra ✓ priority queue ✓
queue ✓

Dijkstra Questions (Network Delay time
path with minimum effort
shortest path in Binary matrix)

→ Problems of Dijkstra :-

1) can't work for -ve edges.

2) can't detect -ve cycle.

vector<int> distance;

priority-queue<P, vector<P>, greater<P>> pq / set<P>

while (!pq.empty())

node = pq.top().second

dist = pq.top().first

pq.pop()

for (ele: adj[node])

next = ele[0]

wt = ele[1]

new_dist = dist + wt

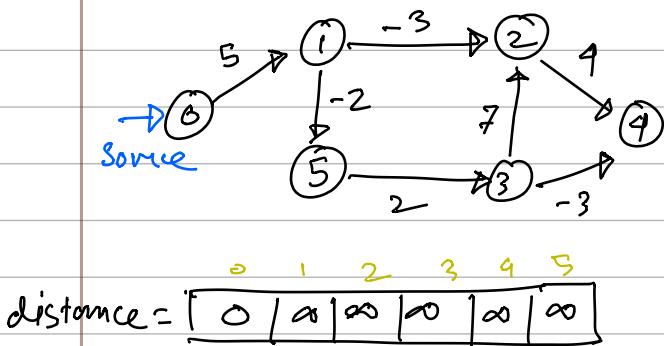

if (new_dist < distance[next]) { * st.erase({distance[next], next}) }

distance[next] = new_dist

pq.push({new_dist, next}) }

→ Bellman Ford Algo :-

① works only on directed graph.

edges

$(3, 2, 7)$
 $(5, 3, 2)$
 $(0, 1, 5)$
 $(1, 5, -3)$
 $(1, 2, -2)$
 $(3, 4, -2)$
 $(2, 3, 3)$

iterate over
 edges & update
 distance array

Do this not more
 than $\frac{V-1}{\text{no. of vertices}}$ time

```

for (int i=0 ; i< V-1 ; i++) {
  for (e : edges) {
    u = e[0]
    v = e[1]
    w = e[2]
    if (distance[u] !=  $\infty$ 
        && distance[u] + w < distance[v])
      distance[v] = distance[u] + w;
  }
}
  
```

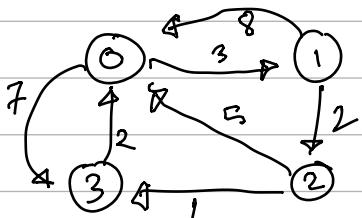

* edges array can be in any order ; but every $V-1$ iteration must follow the same order of edges.

* if done more than $V-1$ time ; -ve cycle will come at play

Time complexity Dijkstra : $E \log V$
 Bellman Ford : $E V$.

Floyd Warshall Algo :-

: min distance from $u \rightarrow v$ check u to v going through all possible vertices w . $u \rightarrow w \rightarrow v$.

 }

$\text{cost} = E \times (4 \times \text{alpha})$

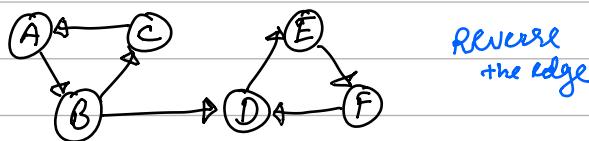

Kosaraju's Algorithm / Strongly Connected Component

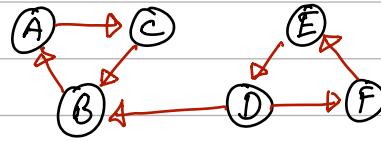

strongly connected components, $\{A, B, C\}$ $A \rightarrow B \& B \rightarrow A$ both possible.
 A, D are not strongly connected $A \rightarrow D$ possible but not $D \rightarrow A$

✓ no. of strongly connected components = 4

✓ Intuition :-

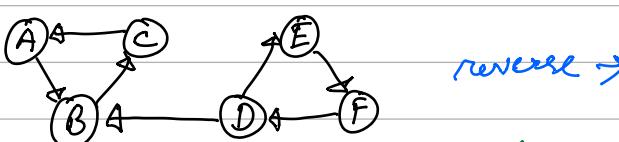

Reverse the edge

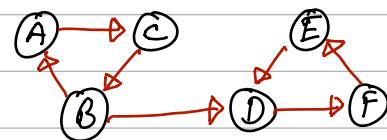

* DFS from A gives $\{A, C, B\}$ ssc.

But what if the graph was,

reverse \rightarrow

* DFS from A will go towards D, E, F.

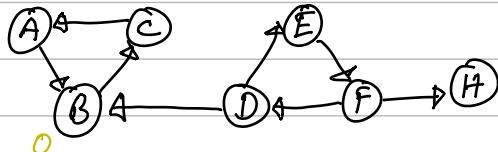

For this case we need to start DFS from D, E, F side not A, B.

* So we need a Topological order to start DFS from.

\rightarrow Kosaraju's Algo :-

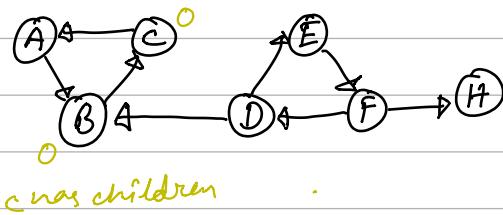

- ① Generate topological order stack
- ② Generate reverse edge graph
- ③ DFS from stack top.

Dry Run,

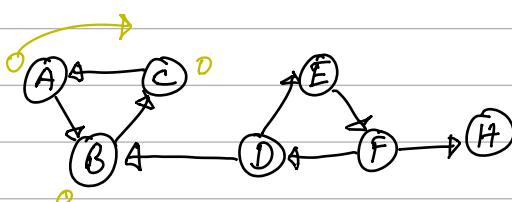

B has children
don't push.

visited
B

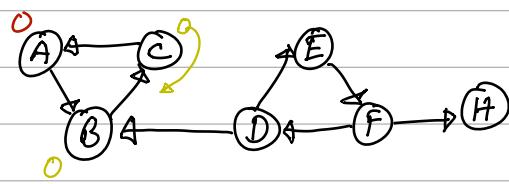

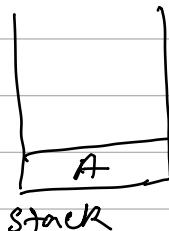

C has children

visited
B, C

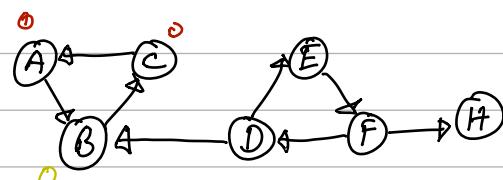

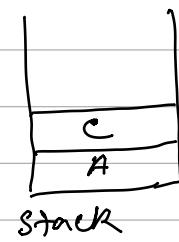

A has children,
but visited, push

visited
B, C, A

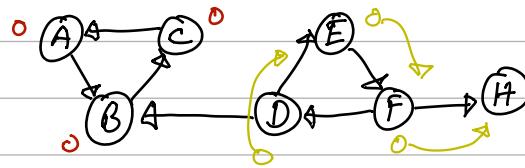

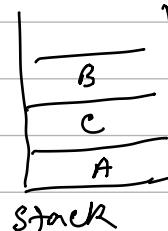

C has no children
push C

visited
B, C, A

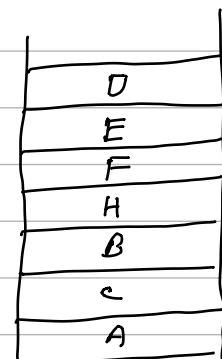

B has no children
push B

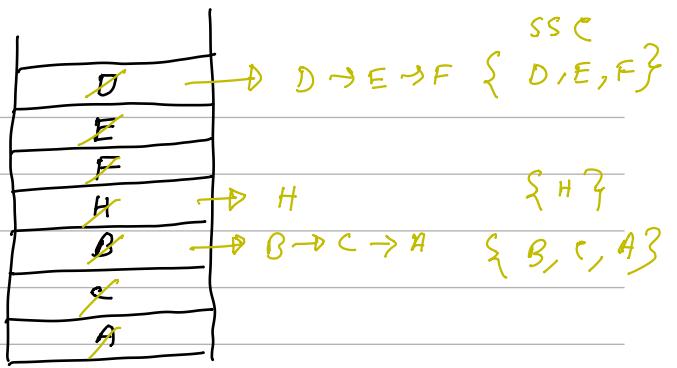

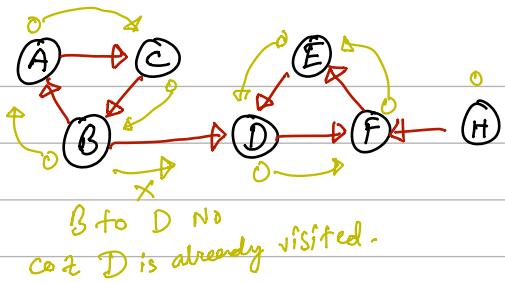

visited
B, C, A

visited
B, C, A,
D, E, F,
H

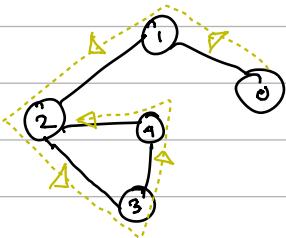

Now Reverse edge & run DFS From the top of Stack,

(Eulerian Geometry) :-

→ Eulerian path :-

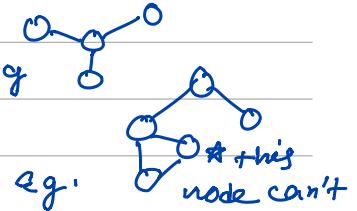

A path of edges that visits all the edges in a graph exactly once.

entanglement path: 0, 1, 2, 3, 4

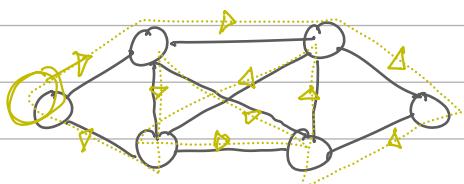

not all graphs have eulerian path

* not all node could give eulerian path starting from it.

→ Eulerian Circuit :-

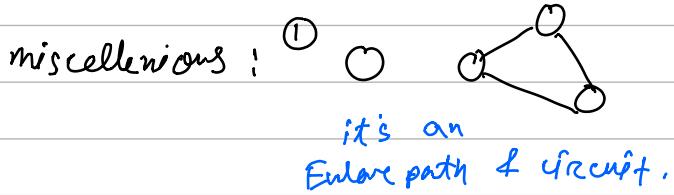

An eulerian path that starts and ends on the same node called Eulerian circuit

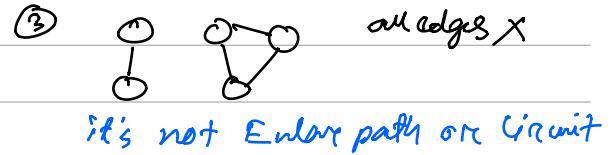

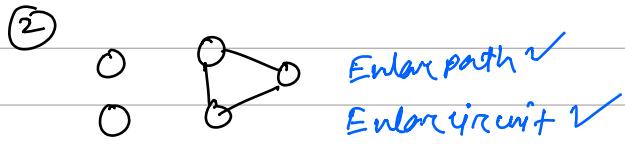

If there's Eulerian Circuit then every node can be the starting node.

if a graph does not have Eulerian Circuit- then :-

- ① Either you won't be able to come back to start node
 - ② or you will not be able to visit all edges of graph.

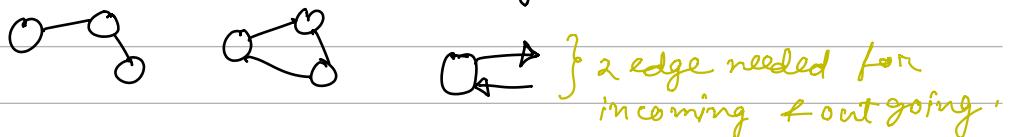

all edges ✓
once ✓
start node == finish node ✓

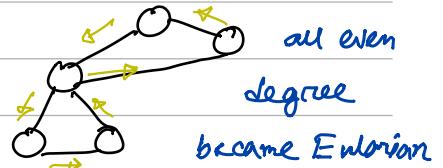

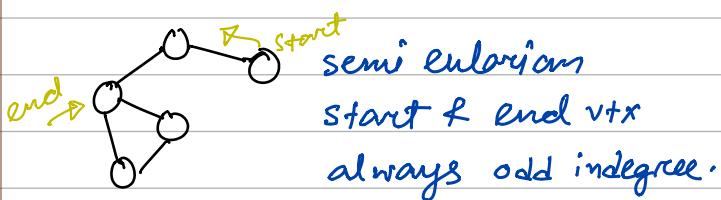

* all non zero degree nodes must connect to a single component.

Fact 1 :- all nodes must have even degree to have Euler Circuit

* a graph which has Euler path but doesn't have Euler circuit called Semi-Eulerian Graph.
otherwise it's called Eulerian Graph.

✓ semi Eulerian : 1) all edges ✓
2) Start == end X

③ no of odd degree = 2 Euler Path ✓
Euler circuit X

no. of odd degree = 0 Euler circuit ✓

→ check for Non Eulerian, Semi Eulerian or Eulerian :-

① check all non zero degree nodes are connected.

② count no. of nodes where $\text{degree} = \text{odd}$.
